FULL STACK DEVELOPMENT INTERNSHIP

FINAL PROJECT REPORT

STUDENT FEEDBACK MANAGEMENT SYSTEM

Project Type: Full Stack Web Application

Technologies: HTML5, CSS3, JavaScript, Node.js, Express.js, MongoDB

Main Features: Student feedback form, login, admin dashboard, feedback management and reports

Submitted By

Name: Padma Sri .P

Roll No.:3702410627

Department:CSE(AIML)

Academic Year: 2026

Internship: Full Stack Development

Final Project Submission

CERTIFICATE

This is to certify that the project report entitled **“Student Feedback Management System”** has been prepared as part of the Full Stack Development Internship. The project demonstrates the design and development of a web-based application using front-end, back-end and database technologies.

Intern Name: Padma Sri .P

Registration / Roll No.: 3702410627

Institution: Aarapadai veedu institute of technology

Internship Organization: upSkill Campus / Uniconverge Technologies (P) Ltd.

DECLARATION

I hereby declare that this project report is prepared for the Full Stack Development Internship. It presents the project concept, technologies, modules, implementation approach, testing and future scope of the Student Feedback Management System.

Name: Padma Sri .P

Signature:Padma Sri

Date:23-09-2026

ABSTRACT

The **Student Feedback Management System** is a full-stack web application designed to collect, store and manage student feedback in a structured and convenient manner. Manual feedback collection using paper forms or separate files can be time-consuming and difficult to maintain. The proposed system provides an online interface through which students can submit feedback and authorized administrators can view and manage responses.

The application uses HTML, CSS and JavaScript for the front end, Node.js and Express.js for the server side, and MongoDB for database storage. The system follows a client-server approach and can be extended with authentication, analytics and downloadable reports.

Keywords: Full Stack Development, Web Application, Student Feedback, HTML, CSS, JavaScript, Node.js, Express.js, MongoDB.

1. PROJECT OVERVIEW

1.1 Project Name

Student Feedback Management System

1.2 Project Type

Full Stack Web Application

1.3 Problem Statement

Educational institutions require regular student feedback to understand teaching quality, course delivery and student experience. Manual feedback collection can result in duplicate records, slow analysis, paper usage and difficulty in maintaining historical data.

1.4 Proposed Solution

Develop a responsive web application where students can submit feedback online and administrators can securely view, manage and analyze the submitted responses.

1.5 Objectives

• Provide a simple feedback form.
• Store feedback in a structured database.
• Provide an administrator dashboard.
• Reduce manual paperwork and data entry.
• Make feedback records easier to manage and review.

2. TECHNOLOGIES USED

Layer	Technology	Purpose
Frontend	HTML5	Structure of web pages and forms
Frontend	CSS3	Styling, layout and responsive design
Frontend	JavaScript	Validation and user interaction
Backend	Node.js	Server-side JavaScript runtime
Backend	Express.js	Routes, APIs and server logic
Database	MongoDB	Storage of feedback and user records
Tools	VS Code / Git	Development and version control

HTML5: Creates page structure, forms, buttons and content.

CSS3: Provides layout, spacing, typography and responsive presentation.

JavaScript: Handles validation and interactive features.

Node.js & Express.js: Processes requests and provides backend APIs.

MongoDB: Stores feedback records and application data.

3. SYSTEM ARCHITECTURE

The application follows a three-layer architecture: presentation layer, application/server layer and database layer.

Student / Administrator
↓
Frontend HTML + CSS + JavaScript
↓ HTTP / REST API
Backend Node.js + Express.js
↓ Database Operations
Database MongoDB

Data flow: Student fills the feedback form → frontend validates input → backend receives the request → MongoDB stores the record → administrator retrieves feedback through the dashboard.

4. MAIN MODULES

4.1 Student Module

• Student registration/login (if enabled).
• Feedback form with rating and comments.
• Form validation before submission.
• Success message after submission.

4.2 Administrator Module

• Administrator login.
• Dashboard for viewing feedback.
• Search/filter feedback records.
• Manage or remove records where permitted.

4.3 Database Module

• Store feedback information.
• Retrieve records for the dashboard.
• Maintain structured records for future analysis.

4.4 Reporting Module

• Display total submissions.
• Show rating summaries.
• Provide a basis for future charts and downloadable reports.

5. MAIN FEATURES

Feature	Description
Online Feedback Form	Students submit ratings, comments and basic details.
Form Validation	Checks required fields and prevents invalid submissions.
Admin Dashboard	Authorized users can view submitted feedback.
Database Storage	Feedback is stored in MongoDB for later retrieval.
Search / Filter	Feedback can be organized for easier review.
Responsive UI	Pages are designed to work on laptop and mobile screens.
Security Foundation	Authentication and server-side validation can protect access.

6. DATABASE DESIGN

A MongoDB collection can be used to store feedback documents. A typical feedback record may contain:

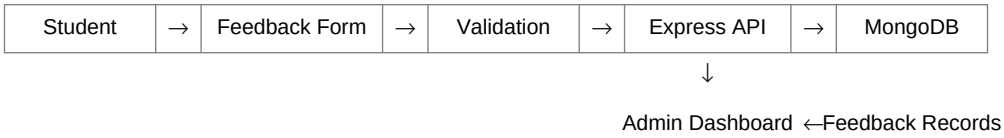

Field	Example / Type	Purpose
studentName	String	Student name
studentId	String	Unique student identifier
course	String	Course or subject
rating	Number	Rating such as 1–5
comments	String	Written feedback
createdAt	Date	Submission date/time

Example document: studentName, studentId, course, rating, comments and createdAt.

7. PROJECT WORKFLOW

1. User opens the web application.
2. Student enters the required details.
3. Student selects ratings and writes comments.
4. JavaScript validates the input.
5. Data is sent to the Express.js backend.
6. Backend validates and stores the record in MongoDB.
7. Administrator opens the dashboard.
8. Administrator reviews and manages feedback.
9. Feedback can be summarized for reporting.

Simple Flow

8. TESTING

Test Case	Expected Result	Status
Submit empty form	Validation message displayed	Pass
Submit valid feedback	Feedback saved successfully	Pass
Invalid rating	Invalid input rejected	Pass
Open admin dashboard	Dashboard loads correctly	Pass
Retrieve feedback	Stored records displayed	Pass
Search/filter	Matching records displayed	Pass
Responsive screen	Layout adjusts to screen size	Pass

Testing verifies input validation, data submission, database operations, dashboard access and basic responsive behavior.

9. BENEFITS

• Faster feedback collection and management.
• Reduces paperwork and manual data entry.
• Centralized storage of feedback records.
• Easier review by administrators.
• Web-based access.
• Can be extended with analytics and reporting.

10. LIMITATIONS

• Requires a working web server and database connection.
• Advanced analytics are not included in the basic version.
• Authentication and authorization must be correctly configured before production use.
• Data quality depends on accurate user input.

11. FUTURE SCOPE

• Add secure role-based authentication.
• Add charts for rating analysis.
• Add PDF/Excel report generation.
• Add email notifications.
• Add anonymous feedback mode where appropriate.
• Deploy to a cloud platform.

12. CONCLUSION

The Student Feedback Management System provides a practical example of full-stack web development. It combines a user-friendly frontend, a server-side application and a database to collect and manage feedback. The project demonstrates skills in web development, JavaScript interaction, REST API concepts, database operations, validation and testing.

The system can serve as a foundation for a larger institutional feedback platform. With additional security, analytics, deployment and reporting features, it can be expanded for real-world use.
